

# Project Introduction: Personal Weather Predictor

Marlon Pierce, Suresh Marru

CSCI-B 649 Science Gateway Architectures

INDIANA UNIVERSITY BLOOMINGTON

SCHOOL OF INFORMATICS AND COMPUTING

# Today's Outline

- Motivating weather prediction use case
- Linked Environment for Atmospheric Discovery
- Personal Weather Predictor
- Advance Track Project

# Logistics

- Project Team Questions?
- Associate Instructors
  - Anuj Bhandar (anujbhan@umail.iu.edu)
  - Ajinkya Dhamnaskar (adhamnas@umail.iu.edu)
  - Abhijit Karanjkar (aykaranj@umail.iu.edu)
  - Mangirish Wagle (mawagle@umail.iu.edu)

# Numerical Weather Prediction (NWP)

- Forecasting technique to use computer models to simulate the evolution of the atmosphere.
- NWP forecasts can be improvised by tuning the computer model but largely by improving initial conditions.
- The models are initialized by analysis of observational data from current weather.

# NWP Forecasts

- Atmosphere is a physical system governed by the laws of physics which are expressed as mathematical equations.
- Initial conditions are determined from observations at a given initial time.
- Future weather is forecasted calculating how the current state changes over time.

# NWP Challenges

- The equations are very complicated (non-linear) and a powerful computer is required to do the calculations.
- The accuracy decreases as the range increases; there is an inherent limit of predictability.

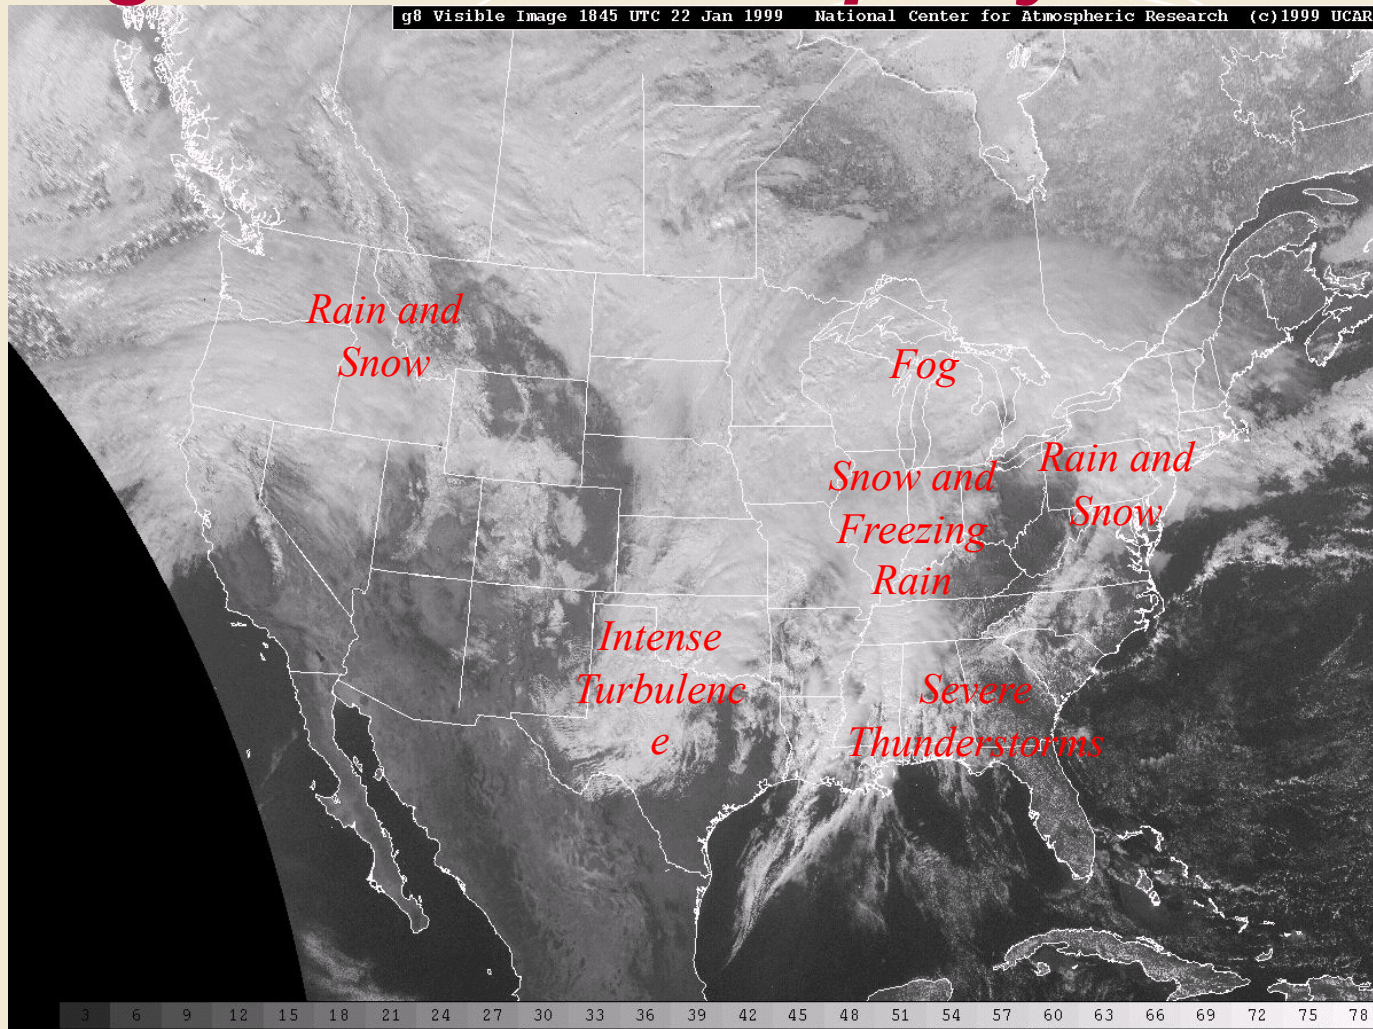

# NWP techniques improve ..But ..

- Increased power of supercomputers, allowing much finer numerical resolution and fewer model approximations.
- Improved representation of small-scale physical processes (clouds, precipitation, turbulent transfers of heat, moisture, momentum, and radiation) within the models.
- More accurate methods of data assimilation, which result in improved initial conditions for the models.
- ..but the weather models are still static ..

# *Weather is Local, High-Impact, Heterogeneous and Rapidly Evolving*

# Fundamental Research Question

Can we better understand the atmosphere, educate more effectively about it, and forecast more accurately if we **adapt** our technologies and approaches to the weather **as it occurs**?

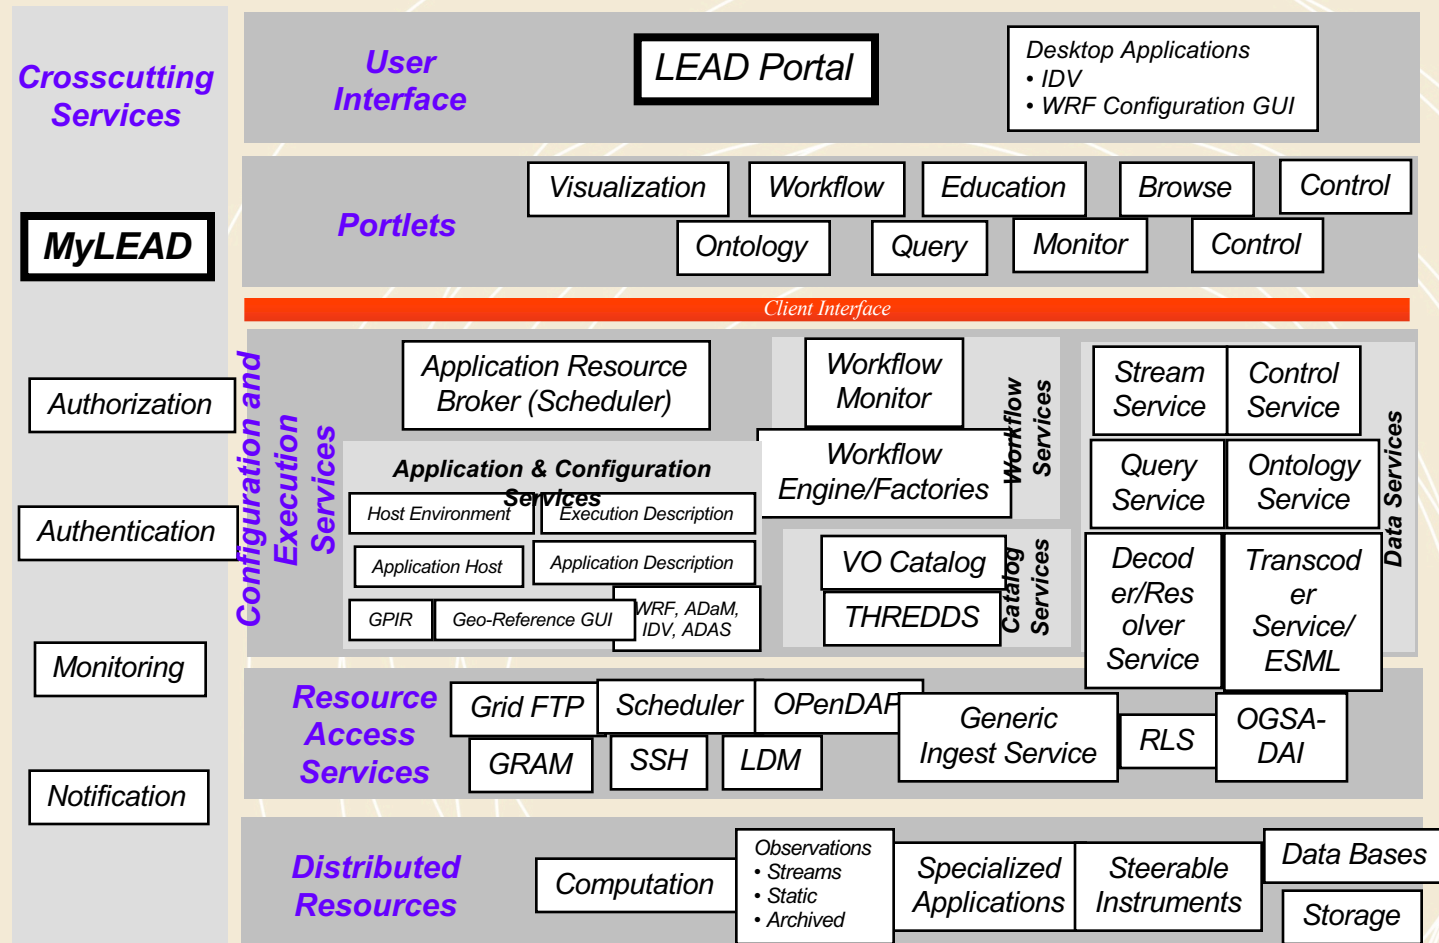

INDIANA UNIVERSITY BLOOMINGTON

SCHOOL OF INFORMATICS AND COMPUTING

CSCI-B 649 Science Gateway Architectures

# (micro)service architecture in 2003

# If LEAD started in 2016

- Leverage the open source software resulting from Web-Scale Architectures.
- Focus on “Science” without necessarily getting distracted to “engineer” a scalable, fault tolerant and interoperable distributed system.

# Project Use Case

- Develop a simplified personal weather predictor
  - Mock the implementation of services to avoid getting distracted.
  - Focus on the Science Gateway Architecture a special case of “Distributed System”.

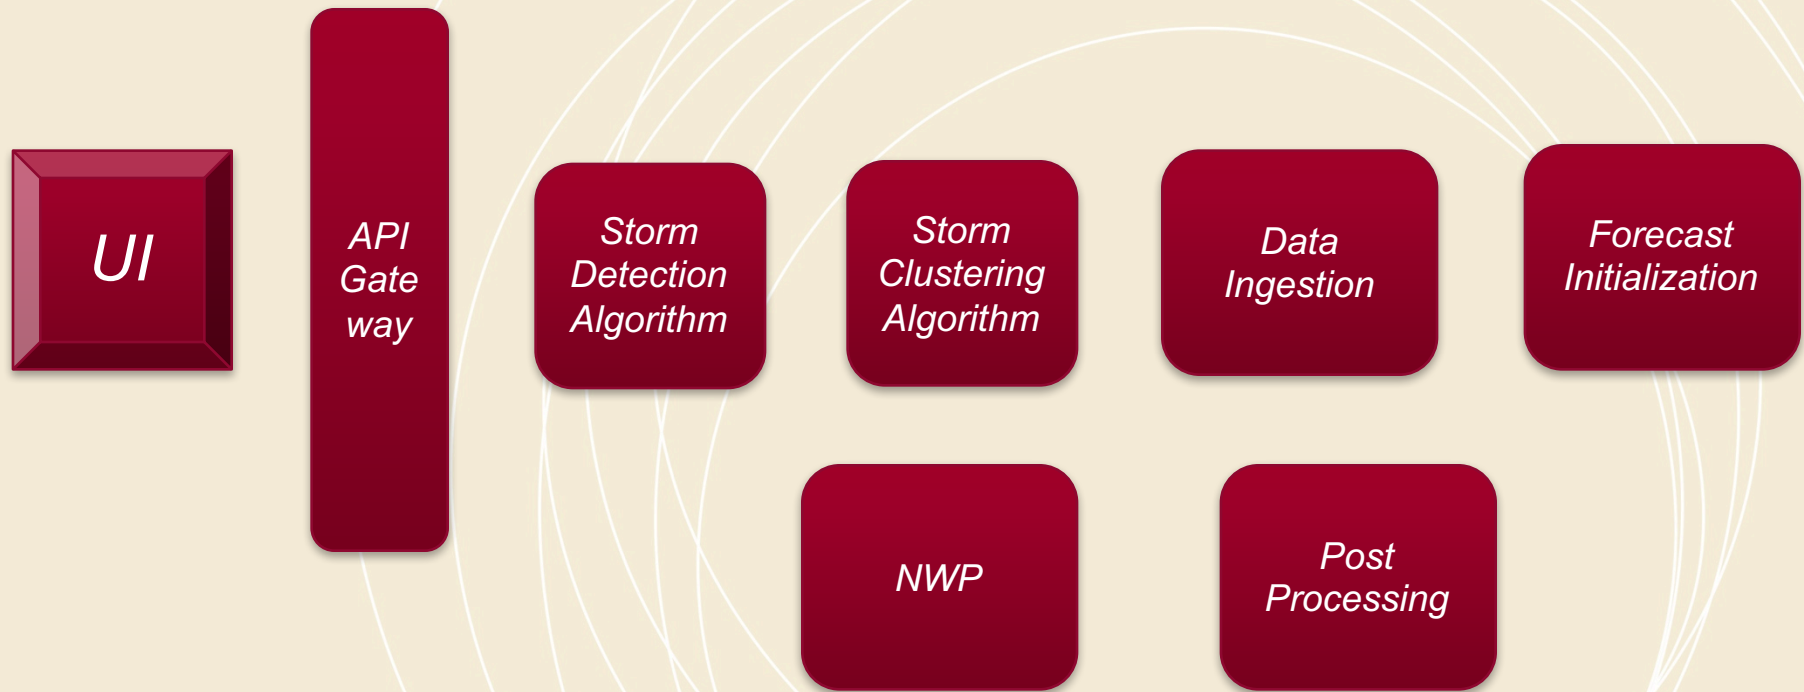

# Weather Predictor

- Two distinct and dependent aspects:
  - Diagnostic
    - Assimilate initiate state of the atmosphere.
  - Prognostic
    - Knowledge of the physical laws which determine the evolution of the atmosphere.
    - Requires running weather simulation models on supercomputers.
    - Focus of project milestone 4

# Implement “mock” services

# Project Milestone 1 Preparation

- Learn how to write API's in REST and Apache Thrift
- Decide on your Programming Languages.
- Decide on your Web Framework.
- Learn how to use build systems like Apache Maven.
- Test-Driven Development

# Thank You!
